Sometimes the best way to save money is by doing it yourself. Let's look at this approach to DMX 512 cabling for your [DJ lighting](#) or band lighting system.

The Options

There are many options for off the shelf [DMX 512 cables](#) for lighting systems. Cables usually come in lengths from 3 feet to 100 feet and sometimes longer. If you are outfitting a larger system, purchasing a large number of cables gets pricey pretty quick. One of the advantages to making your own is since you are supplying the labor, cost can be reduced substantially.

Making Cables

To make cables, first you will need what is called **bulk cable**. It is usually sold in reels of 250, 500 or 1000 feet. Then you will need your connectors. Most DJ level DMX 512 gear uses **3 pin XLR connectors**, and higher end fixtures almost always employ 5 pin XLRs. Your next step is to grab a soldering iron and solder suitable for making cables. We will not go into detail on cable construction here, but it can take a little practice to get right, but the time spent will be worth it in the long run due to the cost savings of making your own.

Custom Lengths - Another Advantage

Another advantage to doing it yourself is you can **customize lengths** to suit the installation or application at hand. Fixture to fixture jumps on a truss seldom get over 2 feet. The reduced amount of cable can add up to weight savings and a cleaner look.

Time Vs Money

The only disadvantage is **time**. If you have a busy schedule, and have the budget, off the shelf
